**Measurements:**  
Simple to complex  
and every year

**Grade level link(s)**

Fifth grade

Third grade

Fourth grade

Second grade

First grade

Kindergarten

### grade                      Gravitational Force and Resultant Motion Strand

**K** Introduce forces as push or pulls through fairy tales: Goldilocks, Humpty Dumpty, The 3 Bears.

- Build chair to support mass of 2 different Goldilocks dolls
- Finds ways to keep Humpty from falling / design Personal Protective Equipment

**1<sup>st</sup>** Introduce work through the folk tale of John Henry

- Build puff “steam engines”
- Build boats that float and move by wind power.
- Build lunch box with healthy foods that for J.H.

**2<sup>nd</sup>** Introduce potential and kinetic energy as well as friction.

- Build a marble drop which meets specific design criteria.

**3<sup>rd</sup>** Introduce mechanical advantage of work through simple machines as well as finding mass in grams and weight in Newton.

- Design a pulley system with specific mechanical advantage requirements.

### grade                      Gravitational Force and Resultant Motion Strand

---

**4<sup>th</sup>** Introduce calculations of volume, density, buoyant force, power, live and dead loads, as well as the construction of free body diagrams and technical drawings.

- Build and test clay dugouts
- Calculate buoyant force and create free body diagram
- Sketch technical diagram for a K'Nex car.
- Build car, test, measure and calculate performance parameters.

**5<sup>th</sup>** Introduce various types of bridge designs, various forces acting on a bridge (tension, torsion, compression). Calculate their strength, distributive load, state of failure.

- Calculate forces and show applied forces through free body diagram
- Design, build model bridge scaled to a design criteria load. **(fails when expected to do so)**
- Complete a cost analysis of their bridge design.

# An Integrated Experience for Elementary Engineering Education

## Quartz Crystal

## Science

- Quartz has an interesting property when it is compressed.

## Air Bag Technology STEM

## Learning Community Professional Development Activity

# An Integrated Experience for Elementary Engineering Education

### Science

- Quartz has an interesting property when it is compressed.
- Force is a pull or push.
- Work is done if the force moves something.

# An Integrated Experience for Elementary Engineering Education

# Air Bag Technology-STEM

A volt meter measures the difference between the energy level at the red terminal and the energy level at the green terminal.

STEM

## Engineering

- The voltage (energy) difference between the red wire and the black wire goes up and down.
- The voltage (energy) difference between the red wire and the black wire goes up when the crystal is compressed.
- The voltage (energy) difference between the red wire and the black wire goes down as the crystal returns to its original shape.
- Early application- vibrator in a handheld microphone.

- Where does the force come from to make the microphone piezoelectric material vibrate?

# An Integrated Experience for Elementary Engineering Education

A volt meter measures the difference between the energy level at the red terminal and the energy level at the green terminal.

STEM

Piezoelectric material

### Mathematics

- The voltage (energy) difference equals the voltage value on the red wire minus the voltage value on the black wire.
- The work done is the value for the force multiplied by the distance the crystal compresses.
- For this sensor, if the force applied equals 200 Newton and the distance compressed equals 0.01 meters, how much work was done to compress the sensor?

200 Newton multiplied by 0.01 meters equals 2 Newton-meter.

Note: 1 Newton-meter is also called 1 Joule

Potassium Nitrate

$\text{KNO}_3$

(solid state)

## ● The reaction

heat

Nitrogen in the gas state

## Science

- The airbag's inflation system uses a hot blast of the nitrogen to inflate the airbag.

## Engineering

- The reactants can be packaged as two solids in a container.

## Mathematics

- The volume of the gas at atmospheric pressure can be calculated.
- The time it takes to blow up a bag of the nitrogen gas can be measured.

# An Integrated Experience for Elementary Engineering Education

## Airbag Information Supplementary Information

### **The challenge:**

Early efforts to adapt the airbag for use in cars were restricted by prohibitive prices and technical hurdles involving the storage and release of compressed gas. Engineers wondered:

If there was enough room in a car for a gas canister ?

Whether the gas would remain contained at high pressure for the life of the car?

How the bag could be made to expand quickly and reliably at a variety of operating temperatures and without emitting an ear-splitting bang?

# An Integrated Experience for Elementary Engineering Education

## Airbag Information

### The design

#### Material:

The bag itself is made of a thin, nylon fabric, which is folded into the steering wheel or dashboard or, more recently, the seat or door.

#### The airbag's inflation system :

The system uses the reaction of sodium azide ( $\text{NaN}_3$ ) with potassium nitrate ( $\text{KNO}_3$ ) to produce nitrogen gas. Hot blasts of the nitrogen inflate the airbag. Similar to rocket technology but at a much, much smaller scale, the inflation system uses a solid propellant and an igniter. Small solid-propellant inflators (see [How Rocket Engines Work](#) for details) were manufactured that burn extremely rapidly to create a large volume of gas to inflate the bag..

#### The airbag's inflation system :

Upon impact and the generation of a spark do to the voltage created when the crash impact compressed the quartz's the bag then literally bursts from its storage site at up to 200 mph (322 kph). The gas quickly dissipates through tiny holes in the bag, thus deflating the bag so you can move. Even though the whole process happens in only one-twenty-fifth of a second, the additional time is enough to help prevent serious injury. The powdery substance released from the airbag cornstarch or talcum powder, which is used by the airbag manufacturers to keep the bags pliable and lubricated while they're in storage.
